

The Center for Energy-Smart Electronic Systems

January 2014

an NSF Industry/University Cooperative Research Center

*Enabling Energy Efficient Data
Centers for New York and the Nation*

The Center for Energy-Smart Electronic Systems

Center Vision: To create electronic systems that are self sensing and regulating, and are optimized for energy efficiency at any desired performance level.

ES2 works in partnership with industry and academia to develop systematic methodologies for operating information technology, telecommunications, and electronic systems and cooling equipment

The ES2 Team

Binghamton University

Bahgat Sammakia, Kanad Ghose, Bruce Murray

The University of Texas at Arlington

Dereje Agonafer, Alan Bowling

Villanova University

Alfonso Ortega, Amy Fleischer, Gerald Jones, Aaron Wemhoff

The Georgia Institute of Technology

Yogendra Joshi, Satish Kumar, Minami Yoda

ES2 Industry Partners

*Founding members of NSF Industry/University Cooperative Research Center
First Industrial Advisory Board meeting: December 8-9, 2011*

- Corning, Inc.
- IBM
- Panduit
- Microsoft
- Bloomberg
- Degree Controls
- Facebook
- Future Facilities
- Internap
- Sealco/Bick Group
- Wolverine Microcool
- NYSERDA
- Commscope
- Verizon
- Comcast
- Steel Orca
- DVL
- Mestex
- Quanta Cool
- Rambus
- Triad Tiles

Why have a roadmap ?

A roadmap process is an approach to connect your organizational vision, values and objectives to tactical and strategic actions that enable the achievement of those objectives

A roadmap **MUST** be a dynamic and responsive plan

Key elements of a successful I/UCRC roadmap:

- Developed inclusively, Academia-Industry-NSF
- Contributes to the integration of research, technology and business
- Displays the interaction between research and development and products over time
- Defines: actions, interdependencies, routes and alternate routes (back up plans)
- The projects must be intrinsically collaborative

The life cycle for a roadmap

Formative Stages:

- Setting the vision, developing a timeframe, defining organizational goals and objectives
- Developing the initial roadmap

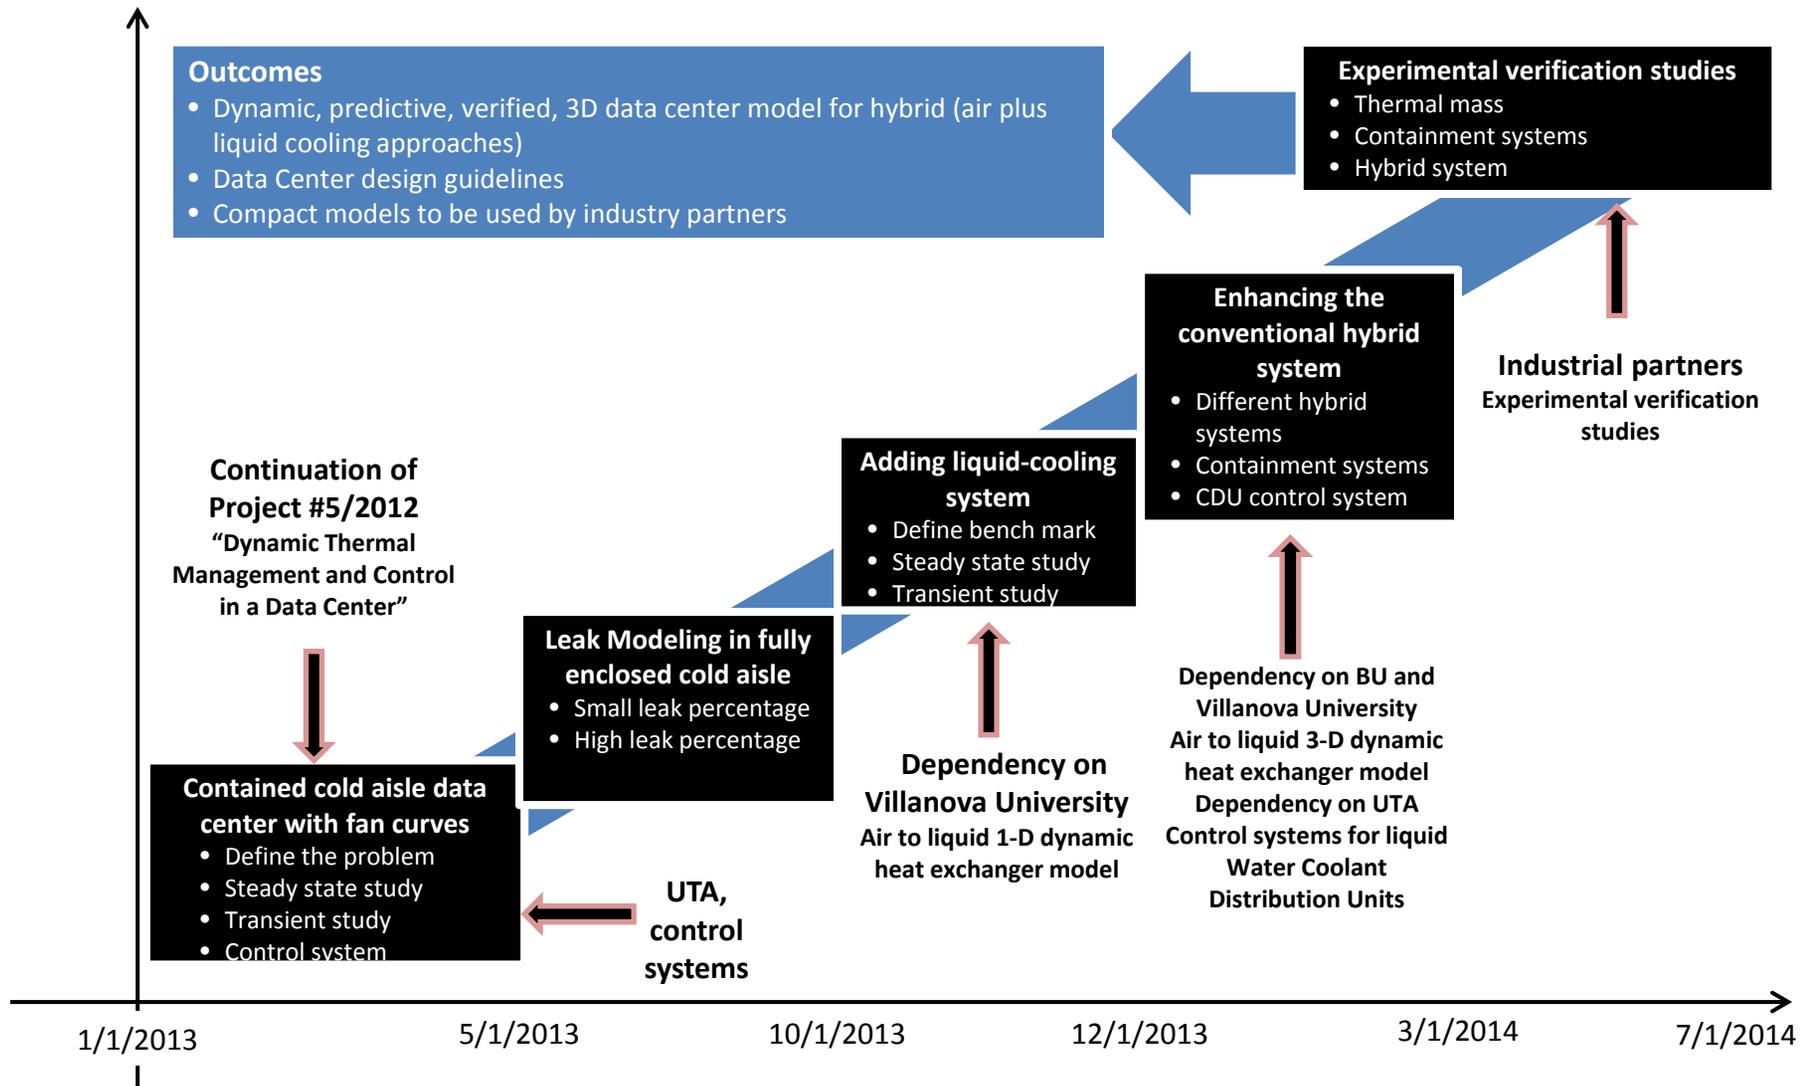

Cyclical Stages (annual or bi-annual):

- Implementation of the roadmap
- Updating and adjusting the roadmap

How we established our initial roadmap

- Vision and mission setting
- In full consultation with partner companies
- Defined key product related objectives, then defined key gaps in knowledge and research objectives
- Defined projects and dependencies between them

Example of a project road-mapping activity
from 2013

Five-Year Technology Roadmap

Determining key intrinsic energy consumption inefficiencies at every level, from devices to entire systems

Techniques for managing data centers synergistically using predictive models for computing workload and thermal trends

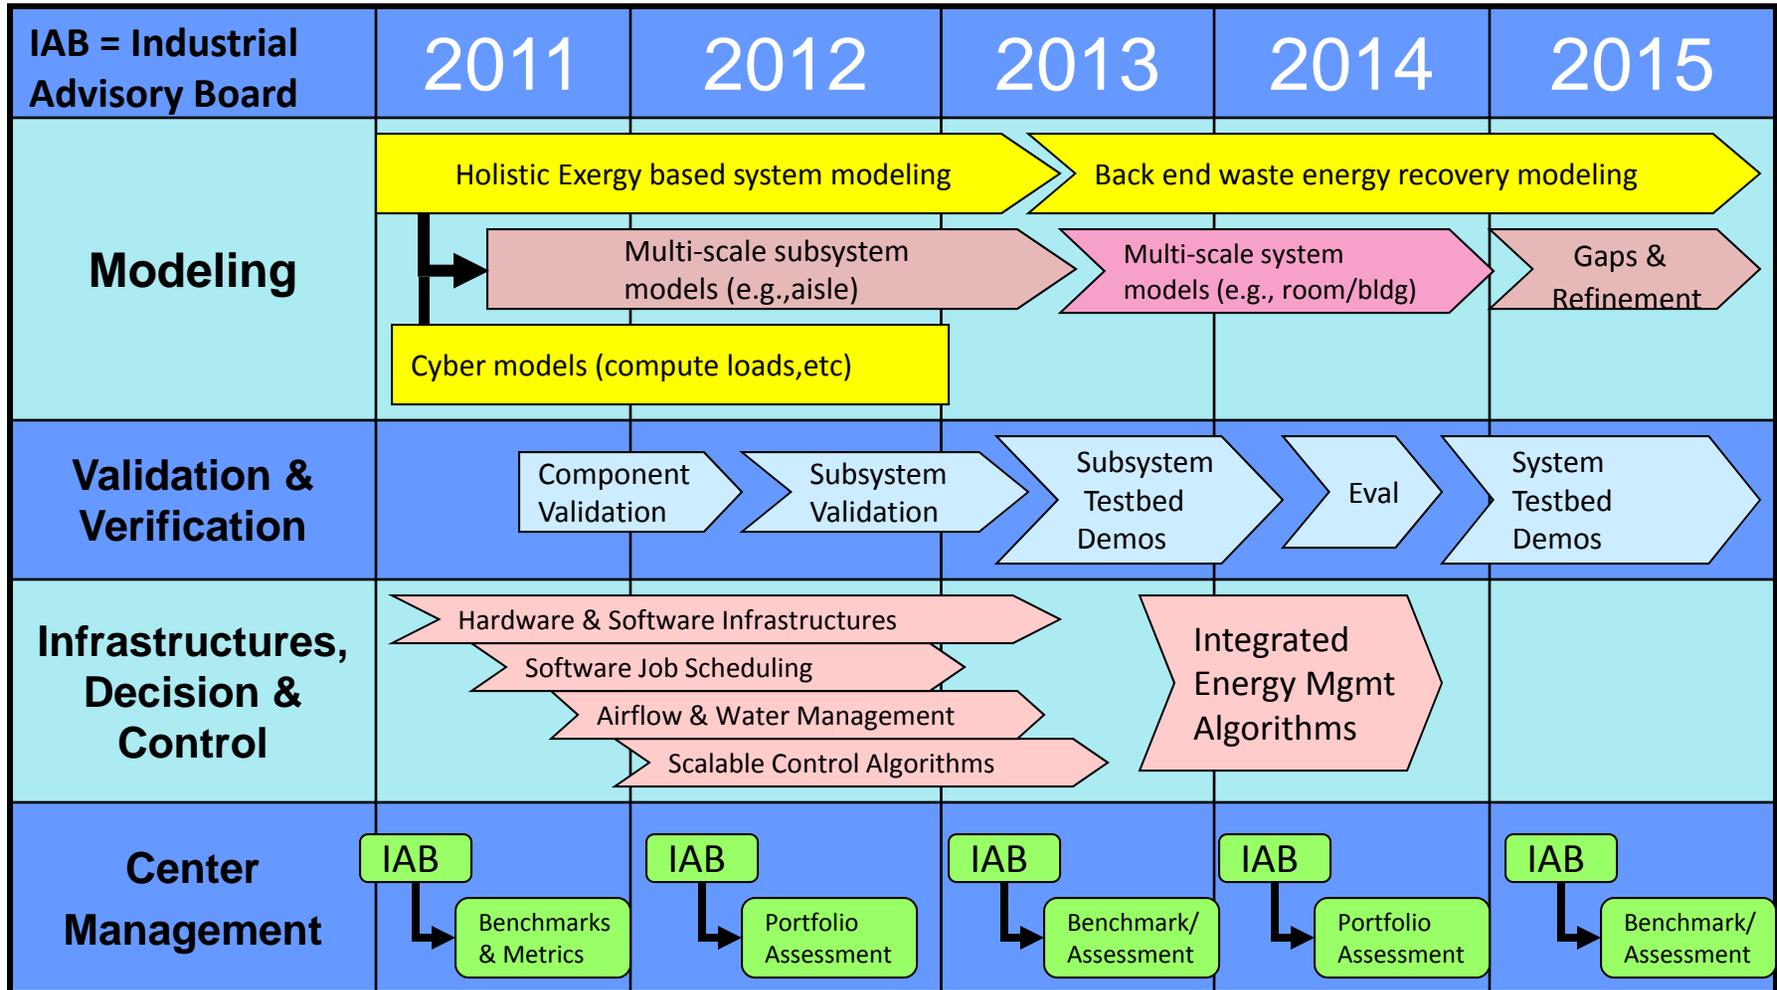

Linux kernel level techniques for implementing energy-aware virtualization, scheduling and synergistic management of the IT equipment and cooling systems

Microarchitectural techniques for improving energy-efficiency of server chips, DRAM and storage systems

Airflow and liquid cooled system management techniques using compact models continuously validated with live data

Techniques for improving the energy efficiency of buildings and containers

Center Roadmap

ES2 Research Progress Highlights

- Designed and implemented short-term load prediction mechanism
- Completed initial implementation of group-based scheduling scheme that can control temperature distribution within a data center
- Developed a comprehensive analytical-numerical study for transient analysis of cross-flow heat exchangers
- Developed thermal dynamic models for cross-flow heat exchangers and solved numerically for predicting the impact of variations in inlet temperature and mass flow rates
- Designed and implemented energy-budget constrained and temperature-aware VM allocation and scheduling techniques.
- Implemented significant parts of VM/load/energy usage/temperature reporting software
- Used simulation models to demonstrate energy savings potential using integrated silicon photonics technology and parallel fiber links for storage servers

Where ES2 stands with the roadmap

- We are completing our second year of funded projects
- We have just started to discuss conducting a deep examination of our roadmap, including an examination of our objectives

Thank you
